COPYRIGHT STATEMENT

The copyright law of the United States (Title 17, United States Code) governs the making of photocopies or other reproductions of copyrighted materials including foreign works under certain conditions. In addition, the United States extends protection to foreign works by means of various international conventions, bilateral agreements, and proclamations.

Under certain conditions specified in the law, libraries and archives are authorized to furnish a photocopy or other reproduction. One of these specified conditions is that the photocopy or reproduction is not to be "used for any purpose other than private study, scholarship, or research." If a user makes a request for, or later uses, a photocopy or reproduction for purposes in excess of "fair use," that user may be liable for copyright infringement.

The Columbia University Libraries reserve the right to refuse to accept a copying order if, in its judgement, fulfillment of the order would involve violation of the copyright law.

COTTON PRODUCTION IN FLORIDA, 1928-1937

- By Counties -

Acreage planted to cotton in Florida during the 10 year period, 1928-1937, has varied from 90,000 acres in 1936 to 150,000 acres in 1930. The small acreage in 1934, 1935 and 1936 resulted in large part from acreage reductions of short staple cotton, under contract with the Agricultural Adjustment Administration. The following estimates include acreage, yield and production for both short staple and Sea Island cotton. During the 4 years ending with 1937, interest in reviving the Sea Island industry has occurred.

Yield per acre during the 10 year period has varied from 80 pounds in 1932 to 170 pounds in 1930. The yield per acre in 1932 was low because of excessive rains and boll weevil damage. In 1928 yields were low because of the heavy early rains in northwest Florida, where much of the cotton had to be replanted, and unfavorable weather throughout the season. The yields since 1933 have been relatively high, due to increased use of fertilizer, lower weevil damage and the use of better lands for cotton. For 1935, 1936, and 1937, however, the yield of all cotton in some counties was lowered because a portion of the acreage was devoted to the production of Sea Island cotton, which normally yields less than upland cotton.

Production of cotton is expressed in 500 pound equivalent gross weight bales and varies from 18,000 bales in 1932 to 56,000 bales in 1930. The estimates of production are based upon the ginnings within the county as reported to the U. S. Bureau of the Census with adjustments for cross-county movement of seed cotton.

The estimates of acreage planted are based upon the censuses of 1925, 1930 and 1935, available data from the Agricultural Adjustment Administration for the years 1933 to 1937, inclusive, and current reports from crop reporters relating to cotton acreage each year.

The estimates of yield per acre are based on yields computed from acres and bales reported to the Census in Census years and upon current reports from crop reporters relating to yield in each year.

In order to maintain a consistent series of estimates of acreage and of yield per acre over the 10 year period, no estimates for any county have been shown for any year unless the Census has published ginnings for all years. Counties not shown separately are included in "All Other."

H. A. Marks,
Agricultural Statistician.
